1. Report Summary

Table 1: Program summary

Project overview	
Reporting period	1 October 2014 – 30 September 2015
Technical specifications in use	Mixed Species Forest Plantation Boundary Planting Silvopastoral Planting
Geographical areas	Limay and Somoto, Nicaragua
Areas under management	
Total areas put under management from 2015 vintage	309.00 ha eq.*
New areas allocated in 2015 to past year's losses	(4.70) ha eq.
New area allocated to 2015 Certificate issuance	304.29 ha eq.
Total areas under management as reported in previous years	866.03 ha eq.
Additional losses from drought to be replaced by Plan Vivo Buffer	(37.09 ha eq.)
Additional losses from drought to be replaced in 2016	(70.55 ha eq.)
Areas under management (program total)	1,062.68 ha eq.
Smallholders with plan vivos and PES agreements	
Smallholders reported in last annual report	280
Smallholders with existing <i>plan vivos</i> adding new land since last report	9
New smallholders with PES agreements since last report	35
Total smallholders with PES agreements (2015 vintage)	44
Smallholders dropouts from previous vintages	(19)
Total Smallholders with <i>plan vivos</i> and PES agreements (program total)	296
PES and community fund payments	
Total PES payments made to participants through Sep. 30th	USD \$690,380.75
Community Fund held in trust for future payments	
Payments to community fund (program total)	
Plan Vivo Certificates and saleable tCO₂	
Total Certificates generated from this year's planting activities	91,556
Certificates from 2015 vintage allocated to losses from previous years	-1,394
Submission for Certificate Issuance for new areas (2015 vintage)	90,162
Plan Vivo Certificates issued to date (program total)	346,766

*Equivalent hectares (ha eq.) have been calculated based on the tCO₂e sequestered in the original Mixed Species Forest Plantation technical specification. See Appendix 1 for more details.

2. Project Updates

Key events

Inter-American Development Bank offsets with Taking Root

The Inter-American Development Bank (IDB) selected Taking Root to offset its entire carbon footprint this year through a very competitive process. The Bank issued an extensive request for proposals (RFP) process for offset projects of any type, provided that the project be located within the Americas. The CommuniTree Carbon Program was selected due to its clear alignment with the Bank's values and the strong benefits that it brings to communities both concerning climate change mitigation and adaptation. The IDB is the main source of multilateral financing in Latin America.

In February of this year, Andrea Sabelli, the Bank's director of Corporate Social Responsibility visited the project. A team accompanied her from the IDB office in Nicaragua, and she spent a day volunteering with communities to help prepare the tree nurseries for the 2015 planting season.

Key developments

Taking Root wins monitoring award from Rainforest Alliance's Eco-Index

The Rainforest Alliance's Eco-Index honoured Taking Root with an award for 'best monitoring and evaluation' this summer. Rainforest Alliance launched Eco-Index in 2001 to provide the conservation community with an easily accessible vehicle to share project data and reports, lessons learned, and best practices.

<https://takingroot.org/2015/08/monitoring-award-from-rainforest-alliance/>

Op-ed article by Taking Root's Executive Director published in prominent Vancouver newspaper

Earlier this summer, Pope Francis released a papal encyclical – a publically accessible letter to all bishops – that challenged “every person living on this planet” to accept shared moral responsibility for climate change. Kahlil Baker, Executive Director of Taking Root, wrote an op-ed article framing the climate change debate concerning its human impact and how Plan Vivo projects are leading by example. A prominent newspaper in Vancouver B.C – The Vancouver Sun – quickly published the thought-provoking piece. The article can be seen here:

<http://www.vancouversun.com/opinion/op-ed/Opinion+What+does+pope+climate+change+doctrine+mean/11316604/story.html>

Technological developments

Taking Root launched new website

Taking Root launched a new website making it easier for potential partners to connect with the project. The challenge was to find the right balance between ease of understanding and highlighting the thousands of stories and numbers of which the team is so proud. A few of the new features were added, including information on the benefits of partnering with Taking Root; an interactive Google map where partners can see every farm reforested and meet the individual farmers behind the projects; and our up-to-date social impact indicators. See <https://takingroot.org/>

Taking Root's award winning technology takes flight!

Taking Root has licensed its propriety software, the Smallholder Carbon Project Information Management System (SCPIMS), to CRS Guatemala for their development of a new Plan Vivo project. The CRS Guatemala project is working with hundreds of Mayan women who are pregnant and/or have small children that face food insecurity, chronic poverty, and environmental degradation. These women own an average of $\frac{1}{4}$ of a hectare of land. Therefore, the carbon benefit per household is extremely small, and the transaction costs of managing such a project would be unfeasible without the use of the SCPIMS.

Organizational developments

Changes to the Taking Root team

In February, Brooke van Mossel-Forrester left her role as Taking Root's Business Development and Communications Director. Brooke has begun a new journey as a mother and remains connected to the organization as a member of the board. Taking Root is pleased to welcome Brianna LePiane as the new Marketing and Communication Officer. Her experience in marketing and her passion for sustainability make Brianna a great fit for Taking Root.

Grégoire-Rousseau takes on role of president at Taking Root

Jean-Benoît (J.B.) Grégoire Rousseau switched chairs from Director at large to Taking Root's board President. He says that his priorities as president are the same as they were when he was a director. "I want us to scale up – but without losing any of the 'magic.' And, I want to see us extend our impact by sharing our expertise and technology with other groups involved in non-profit tropical reforestation."

Grégoire Rousseau has been involved with Taking Root since he "fell in love with the people and the work they were doing," while volunteering on a committee four years ago. During the day, he is an Associate Partner at McKinsey & Company, a global management-consulting firm.

Key challenges

Second devastating drought leads to multiple farmers giving up in Limay

Nicaragua normally has two 3-month growing seasons per year. The *primera* takes place from May to July when farmers plant their first crop of sorghum, corn and beans after a 6-month dry season. The *postrera* takes place from August to October where farmers plant a second crop. In last year's Annual Report, Taking Root reported how Nicaragua as a whole and Limay, in particular, was devastated by one of the worst droughts in recent history - leading to an almost complete failure of the *primera* planting season. (Fortunately, the *postrera* received abundant rainfall.) This year, Nicaragua was hit hard by another major drought associated with El Niño, which usually makes Nicaragua much drier and hotter during the months of June to August. Major rainfall shortages during *la primera* in most of Nicaragua led to partial and total crop losses. According to the Famine Early Warning Network (FEWS NET), San Juan de Limay in particular was the worst hit.ⁱ Somoto was also affected although not nearly to the same extent. Rainfall shortages had extended into August delaying the planting of the *postrera* as well. The rains did finally come at the end of August and farmers were able to plant a crop. For farmers in the Limay region, this has meant severe food shortages.

Impacts on the CommuniTree Carbon Program

For the CommuniTree Carbon Program, these consecutive droughts have had major implications for the establishment of new trees. These droughts affected, in particular, farmers recruited in 2013 and 2014 in Limay, who had to do planting and replanting in 2014. Their trees suffered high mortality due to last year's drought, and were replanted again this year, but yet again faced serious seedling mortality from the 2015 drought. For many farmers, this has meant a large amount of work for consecutive years without positive results, and many have given up. The sad irony is that trees are much more resistant to droughts than agricultural crops once they have taken root. For this reason, the trees planted in Limay that were already established prior to the drought remain healthy and strong.

Fortunately, Taking Root has two policies in place to mitigate the impacts of such shortfalls in people's investments in the project. The first is that more land is reforested every year than the signed carbon offset sale contracts, so the organization can make up for shortfalls. This way, buyers of offsets from previous years that are lost are automatically allocated to the current year's surplus offsets. This policy is consistent with practice in previous years. The second is the risk buffer through the Plan Vivo Foundation that deducts 15% of saleable offsets to enter a pool with all other Plan Vivo projects across the world to insure against potential "*force majeure*" events such as severe drought. Taking Root has never used the risk buffer in the past because it has always been able to replace its losses. This year, however, Taking Root has had to use the risk buffer for 37.09 hectares of land or 10,991 tonnes.

While the impacts of this drought are mostly on the farmers who are facing major crop failures, Taking Root has registered a loss of \$54,112.36 to make up for the lost ecosystem service payments previously made to the farmers who exited the project. There is also an additional cost of recruiting and training new producers to make up for the producers who are leaving. Taking Root has always sought to avoid using the risk buffer as much as possible and to make up for our shortfalls because we feel that that is the right thing to do. However, due to these extreme circumstances this year, a request has been communicated to the Plan Vivo Foundation.

ⁱ<http://www.fews.net/sites/default/files/documents/reports/Central%20America%20-%20RMU%20-%20August%202015%20-%20English.pdf>

The impacts in perspective

For the past couple of years, the location of new planting has shifted almost entirely from Limay to Somoto. During the 2014 planting season, only 28.2% of the new land was in Limay. In 2015, that proportion dropped even further to 4.7%. In Somoto, where 95.3% of the new plantings occurred, there were no losses due to the drought. Furthermore, after five years of experience working on the project, this year's planting, management and training are the best Taking Root has experienced. While this drought has negatively affected past vintages, appropriate measures have been taken to replace those losses. Furthermore, the performance and management measures of unaffected plantations are better than they have ever been.

New policies implemented to reduce the likelihood of further shortfalls

Taking Root will no longer plant new land in Limay given its erratic weather patterns and susceptibility to droughts. All existing plantations in Limay continue under Taking Root's management. While results in Somoto are stronger than ever, the following policies are being put into place to minimize such risks:

- Every farm newly recruited by a community technician will require a second level of approval from a supervisor that will sign a form attesting that the site meets the following requirements:
 - The soil has a low clay content (clay does not retain water well)
 - The farm has a dependable water source within close enough proximity so that it can be watered if there is a shortfall in precipitation shortly after new seedlings are planted.
 - The farm has, at least, one point that can be accessed by vehicle so that water can be delivered to the site.
 - The farmer understands the required silvicultural tasks of caring for young trees in the event of drought.
- The SCPIMS will classify all plantations (new and old) into three categories that will receive tailored management. The categories and management regimes are as follows:
 - **Vulnerable:** These include all plantations with an average height < 1.3 metres. These represent trees that are at risk of dying due to drought and require intensive management. Supervisors will have to visit and report on each plantation in this category three times per year to ensure that planting is done at the very beginning of the first rains and that the trees are receiving appropriate weeding. The reports will also be reviewed periodically with Canadian and Nicaraguan management. Following one week without rain during the rainy season, all plantations in this management category will be watered. Taking Root will also experiment with organic fertilization to accelerate root establishment while trees are in their vulnerable stage. The objective of management is to get all plantations to the next category as quickly as possible.
 - **Intermediate:** This includes all plantations that have an average height > 1.3 metres but have not yet reached canopy closure. Such trees are likely to survive droughts but still require weeding and pruning so that the trees grow appropriately. The objective of management is to get all plantations in this category to the next level.
 - **Free to grow:** This includes all plantations that have reached canopy closure. At this stage, little silvicultural prescriptions are required beyond the occasional pruning and thinning. Such plantations do not require intensive attention from management.

Future developments

Rainforest Alliance verification

Rainforest Alliance will be conducting an independent verification of the project in November 2015. Third party verification must be done every five years as part of Plan Vivo requirements. This verification will be Taking Root's second independent audit.

New green charcoal reactor to be built

In December of this year, a combustion specialist from Canada will build a new charcoal reactor that efficiently converts waste wood from our forest processing facility into charcoal. The Nicaraguan reactor will be modeled on a 2015 Canadian prototype.

This new reactor will capture and destroy the highly polluting volatile organic compounds (VOCs) routinely released during traditional charcoal production methods in Nicaragua. In the destruction of the VOCs, this new design uses these captured compounds as its energy source.

Not only will this reactor produce charcoal much more efficiently, but it will also displace traditionally produced charcoal that is a major driver of deforestation. Consequently, we expect that every tonne of green charcoal produced (requiring 4 tonnes of waste wood) and sold in the marketplace to reduce greenhouse gas emissions by 15 tCO₂ (2.7 tCO₂ from capturing the VOCs and 12.3 tCO₂ from avoided deforestation). While Taking Root does not currently intend to generate additional carbon offsets from this activity, it is considered an added carbon offset bonus to existing investments in the CommuniTree Carbon Program.

Since the reactor transforms the waste wood from our forest processing facility into green charcoal, Taking Root will be able to pay a higher price for sustainably produced timber thus further incentivizing smallholders to grow trees on their farms.

Changes to project documentation since last annual report

None.

3. Activities, Total Program Size, and Participation

Current land-use activities

Taking Root continues to implement the Mixed Species Forest Plantation, Boundary Planting, and Silvopastoral Planting technical specifications. All technical specifications can be downloaded via the Plan Vivo website:

<http://www.planvivo.org/project-network/communitree-nicaragua/>

Mixed Species Forest Plantation

Land-use activities for 2015 vintage focused mainly on the Mixed Species Forest Plantation. This technical specification involves planting and intensively managing multi-purpose mixed species forest plantations on participating smallholders' land. All of the species selected are native to the region and are chosen in consultation with local smallholder groups and professional foresters.

Boundary Planting

Otherwise known as living fences, Boundary Planting is a way of introducing a variety of tree species along a property line to replace fencing over time, as opposed to building and maintaining fences made of timber. While sequestering carbon dioxide, this system helps diversify income, build long-lasting fences, and produce highly prized timber in the long run. This technical specification was added in 2011.

Silvopastoral Planting

The Silvopastoral Planting technical specification acknowledges the need for cattle pastures by integrating trees and improved pasture with livestock. The trees improve pasture productivity, provide shade, and produce timber and forage for the farmers and their cattle. The short rotation nitrogen-fixing species are harvested at a young age, providing building posts while fertilizing the soil. Silvopastoral Planting sequesters carbon dioxide, provides ecosystem services in the short run, and sustainably-produced, highly prized timber in the long run. Additionally, the system helps improve the pasture below the trees and adds biomass to the soil. This technical specification was added in 2012.

Total participation and program size

Table 2: Summary of total participation and program size to date (all vintages)

Participants		
Total smallholders with registered PES agreements		296 smallholders
Total area reforested		1,062.68 ha eq.*
Technical specifications used	Area covered	Equivalent hectares*
Mixed Species Forest Plantation (original)	99.18 ha	99.18 ha eq.
Boundary Planting (original)	34.80 km	28.54 ha eq.
Mixed Species Forest Plantation	698.81 ha	706.83 ha eq.
Boundary Planting	132.17 km	95.82 ha eq.
Silvopastoral Planting	204.28 ha	132.30 ha eq.

**The equivalent hectares (ha eq.) have been calculated based on the tCO₂e sequestered in the original Mixed Species Forest Plantation technical specification. See Appendix 1 for more details.*

4. Submission for Plan Vivo Certificate Issuance

Recruitment of new smallholders

Community technicians successfully recruited new participants from seven new communities to meet current demand for Plan Vivo Certificates, bringing the project to a total of 68 participating communities. The following is a list of the new communities:

- | | | |
|----------------|-----------------|----------------|
| 1. Icalupe | 4. Santa Teresa | 7. Los Copales |
| 2. Las Tablas | 5. El Rodeo | |
| 3. San Antonio | 6. Jocomico | |

Land changes

In 2015, 112.34 net ha eq. from previous years was lost, and 19 producers from previous years left the program completely. The following are the main causes:

1. As mentioned in Section 2, drought severely affected the wellbeing of the seedlings and younger trees;
2. Smallholders left the program for economic reasons and sold to another smallholder. This reason is separate from the droughts but highly related. This year, Taking Root was unable to convince the new owners of the two parcels under this category to join the project;
3. Smallholders abandoned or moved areas because the soil composition is insufficient for adequate tree growth (soil is too dry or too wet); The farmer in question was unable to allocate other land that could have been used as a replacement (also highly correlated with the drought);
4. The death of a smallholder. In this case, Taking Root was unable to find a replacement participant;
5. One smallholder had legal troubles regarding the ownership of their parcel a year after joining the project.

Appendix 2 provides complete details on land changes in 2015.

Program sales and allocations

The following table summarizes the sale of CO₂ for the 2015 Vintage.

Table 3: Program CO₂ sales and allocations for the 2015 vintage

Total volume of CO₂ forward sold	90,162 tCO ₂
Total sales for 2015 vintage	
Average certificate price	
% of sale price to community fund	60%
Price to community fund per offset	
Number of smallholders allocated to buyers	44
Total area represented by Certificates requested	304.29 ha eq.
Technical specifications applied	Mixed Species Forest Plantation Boundary Planting Silvopastoral Planting

Carbon sales

The following table summarizes the distribution of Plan Vivo Certificates sold to date by vintage. For a detailed list of carbon sales to date, see Appendix 3.

Table 4: Summary of carbon sales to date

Vintage	Certificates purchased	Average certificate price (USD)	Total received (USD)
2010	12,342		
2011	33,684		
2012	66,207		
2013	78,430		
2014	65,941		
2015*	90,162		
TOTAL	346,766		

* Vintage 2015 numbers are as of September 30th, 2015

5. Monitoring Results

Summary of 2015 results for new 2015 *plan vivos*

In July-October 2015, Taking Root conducted monitoring of all new *plan vivos* in 2015. Table 5 below is a summary of these results. Complete details of the monitoring can be found in Appendix 4, which can be requested as a separate PDF document.

Table 5: Summary of 2015 monitoring results for 2015 *plan vivos*

Vintage	2015
Area of land meeting monitoring targets (ha eq.)	287.17
Area monitored (ha eq.)	309.00
Percentage of monitored land meeting monitoring targets	93%
Area not monitored in time for report (ha eq.)	0

Summary of 2014 results for previous *plan vivos*

Due to the continuous growth of the CommuniTree Carbon Program, the time required to monitor 10% of every parcel planted increases every year. For this reason, Taking Root's 2014 Annual Report included 2014 monitoring results for 2014 *plan vivos* and 2013 monitoring results for 2010-2013. The 2014 monitoring results for 2010-2013 *plan vivos* were recorded in early 2015 and are now reported in Table 6 below. 2015 monitoring of 2010-2014 *plan vivos* will be conducted in the coming months and reported in next year's report.

Table 6: Summary of 2010-2014 monitoring results for continuing *plan vivos*

Vintage	2010 [*]	2011	2012	2013
Area of land meeting all monitoring targets (ha eq.)	NA	36.18	193.81	141.32
Area monitored (ha eq.)	0	109.63	222.78	178.89
Percentage of land meeting monitoring targets	NA	33%/97% ^{***}	87%	81%
Area not monitored (ha eq.) ^{**}	24.32	0.03	2.28	0.61

2014 *plan vivos* were reported in the 2014 Taking Root Annual Report.

^{*} 2010 *plan vivos* were not monitored in year five as per the Plan Vivo Technical Specifications.

^{**} The SCPIMS' computer generated random and systematic monitoring point methodology cannot generate monitoring points for very small parcels or portions of parcels leaving residual areas unmonitored, accounting for about half of one percent of the area.

^{***} See text below for explanation.

Interpretation of results

Taking Root assesses the monitoring results through the SCPIMS using a rigorous, comprehensive and statistically unbiased methodology. However, four recently discovered issues with this process mask many of the underlying elements of each parcel that greatly underestimates their positive results.

The first issue is that parcel failures persist throughout time because they are not evaluated against their progress over the previous year but rather where they should be assuming that there were never any failures. A useful analogy is a student who fails the 6th grade being evaluated one year later against the 7th grade as opposed to the 6th grade again. Consequently, once a failure, always a failure. This year, this is what happened to the 2011 vintage. Four years after planting, parcel evaluation involved a basal area target based on growth expectations at that time. However, if tree mortality occurred in any one of the previous years, a corrective action would have been issued to replant. Naturally, those replanted trees would be behind growth targets but they would still be evaluated as if they were four years old. The following year, the trees would be monitored against 5th-year targets, which would again lead to a constant shortcoming.

The second issue is how to represent the complex monitoring results with a single binary (pass/fail) indicator. Depending on their vintage, parcels are monitored using one, several, or all of the following indicators: tree density, pruning, weeding and basal area. In some cases, if any one of those indicators fails, the overall monitoring indicator fails. Having this detailed information facilitates tailored management interventions for each parcel but obfuscates the overall assessment of the quality of a smallholder's parcel. For example, only 33% of the 2011 vintage passed the basal area (as discussed in the first issue) but when taking into account tree establishment, 97% passed.

The third issue is that the monitoring teams only measure tree height and not DBH for trees that are below a certain size. However, a basal area cannot be calculated without a DBH measurement, resulting in a basal area of zero and thus failing the basal area target.

A fourth issue is that some monitoring technicians mistakenly restricted tree measurements to tree species that were planted by the project and not naturally regenerating trees. Natural regeneration is an important component of Taking Root's adaptive management strategy and, therefore, makes results inferior to what they are in reality.

For 2015 parcels, despite the massive drought, Taking Root is very pleased with the incredible dedication of its team to achieve a relatively high success rate. Also, efforts have been put in place to improve operations and management as to increase producer and management knowledge and support. As always, every failed monitoring result will either be replanted or replaced at Taking Root's expense. The outcome of these efforts will be verified in the coming months and reported in the next annual report.

Upcoming changes to monitoring process

To fix the previously mentioned issues with the monitoring process and to improve overall effectiveness, Taking Root will implement the following new measures for the next annual report:

- Update the SCPIMS to include a cloud-based data collection system with offline data syncing capabilities. This system will reduce many data entry points into multiple choices as opposed to entering text and provide dynamic guidance to technicians every step of the way.
- Build species-specific allometric DBH and height prediction models using project data and integrate them into the SCPIMS so that one variable will be automatically estimated using the other variable as a predictor.
- Implement a grading system based on their previous year's results. If the parcel does not pass the grade, the parcel will be marked, and increased monitoring and intervention will be applied. (See section 2 for more information on these interventions.) For these failing parcels, as they do not move up a grade, they will face the same monitoring target in next year's monitoring.
- A revised standard operating procedure for monitoring will be created and provided to monitoring technicians combined with training.

Socio-economic and environmental impacts

The following table displays some of the key socio-economic and environmental impacts of the CommuniTree project during its lifetime.

Table 7: Socio-economic and environmental impacts as of September 30th, 2015

Social impact: Program Participants	Program Total
Participating communities	68
Participating smallholder families	296
Social impact: Employment Created	
Permanent positions	28
Seasonal employment	
Nursery	1,100
Planting	1,515
Other	2
Total seasonal employment	2,617
Total employment created	2,645
Social impact: Employment demographics	
Number of landless farmers employed	422
Number of Men employed	1,982
Number of Women employed	662
Social impact: Capacity development	
Community Project Development Workshops	55
Total session attendance	909
Environmental impact: Trees planted	
Mixed species forest plantations	1,462,306
Silvopastoral plantations	85,860
Boundary plantings	115,390
Total trees planted	1,663,556
Number of unique tree species recorded	71

6. PES Update

Total payments for ecosystem services made

Table 8 below provides a summary of the payments for ecosystem services (PES) made to date for all current participating producers. These figures have been updated since the previous report to reflect land changes for previous vintages from 2010-2014. Details on the PES are found in Appendix 5, which can be requested as a separate PDF document.

Table 8: PES summary – total payments made

Payment year	PES paid (USD)
2010	\$1,226.59
2011	\$9,073.06
2012	\$55,536.69
2013	\$87,856.64
2014	\$94,779.05
2015 (1 Jan. – 30 Sept)	\$88,522.52
TOTAL	\$336,994.57

Total advance payments made

The following table summarizes advance payments to date, updated to reflect any land changes from previous vintages from 2010-2014. These figures have been updated since the previous report to reflect land changes for previous vintages. Taking Root provides all new smallholders with advance payments for planting needs in the first year of their inclusion into the program. These payments are deducted from future PES payments at a rate that mirrors the PES schedule. (See Section 11.3 of Technical Specification – Mixed Species Forest Plantation for the complete PES schedule.)

Table 9: Smallholder advance payments for program establishment and material

Payment Year	Advance payments (USD)
2010	\$3,792.78
2011	\$19,129.43
2012	\$41,753.14
2013	\$33,837.78
2014	\$28,726.28
2015 (1 Jan. – 30 Sept.)	\$44,248.78
TOTAL	\$171,488.19

Additional payments to the community

Other costs covered by the community fund to date include nursery expenses and occasionally grafted fruit trees.

Table 10: Other payments to the community to date

Vintage (calendar year)	Additional payments (USD)
2010	n/a
2011	\$14,220.82
2012	\$33,288.19
2013	\$44,290.74
2014	\$52,616.07
2015 (1 Jan. – 30 Sept.)	\$37,482.17
TOTAL	\$181,897.99

7. Ongoing Community Participation

Taking Root continues to build community participation through existing methods and continuous experiments in the development of new methods. The existing methods used throughout the year include planting manuals, community consultations, community-led training and radio announcements.

Furthermore, Taking Root uses the following methods to engender community participation:

- **Technician training:** the aim is to help technicians better inform the community. Training covers key points such as program financing and the link between the program and climate change. Smallholders are later asked to answer to test the effectiveness of the training and evaluate the success of each technician's communications.
- **Producer exchange workshops:** Smallholders joining the program in 2015 were invited to visit farmers who had joined in previous years to learn from their peers.
- **Community education workshops:** Taking Root staff regularly host information sessions to explain the various activities taking place throughout the year. Workshop themes included pruning and clearing around trees, information on the local environmental laws, and more. The information sessions usually involve a component of learning by doing.
- **Presenting the local forest law:** Following last year's success, the CommuniTree Program has continued holding community workshops specifically on the local forest laws. This approach makes these often complex laws much more tangible for farmers.

8. Breakdown of Organizational Costs

Organizational expenses and revenue

The following table provides an overview of all organizational and operational expenses and revenue in Canadian Dollars from 1 October 2014 – 30 September 2015. These figures include both Canadian and Nicaraguan finances.

Table 11: Organizational expenses and revenues in CAD for reporting period

Reporting Period	1 Oct. 2014 – 30 Sept. 2015
Revenues	
Carbon offset sales	
Other (consulting, other services, operations revenue)	
Grants	
Total revenue	
Expenses	
Human resources	
Transport and vehicles	
Administration, Marketing and Sales	
Operational Costs	
Community Fund	
Issuance, financial fees and exchange rate loss and gains	
Total expenses	
Net income	

Appendix 1: Equivalent Hectare Calculation

“Equivalent hectares” involves using the tonnes CO₂ sequestered per hectare of the original Mixed Species Forest Plantation technical specification as the base unit to compare the other specifications. The following table explains the equivalents per specification compared to the base unit.

Table 12: Equivalent hectares per technical specifications

Technical specification	Tonnes CO ₂ sequestered per unit	Equivalent hectares per tonnage
Mixed Species Forest Plantation (original)	296.3 t/ha	1 ha = 1 ha eq.
Boundary Planting (original)	243.0 t/km	1 km = 0.8201 ha eq.
Mixed Species Forest Plantation	299.7 t/ha	1 ha = 1.0115 ha eq.
Boundary Planting	214.8 t/km	1 km = 0.7249 ha eq.
Silvopastoral	191.9 t/ha	1 ha = 0.6477 ha eq.

Appendix 2: Land changes in 2015

The following tables detail land changes (losses and gains) in 2015 of previous vintages, listed by parcel. Table 13.a details losses that Taking Root has absorbed this year. Table 13.b details the losses that the buffer has absorbed this year, and Table 13.c details losses that Taking Root will absorb next year. Note that 19 unique producers are no longer in the program, which is indicated by “.99” at the end of their Plan Vivo numbers.

Losses marked as a negative indicate gained land or tCO₂. This scenario occurs when a farmer needs to move part or all of their parcel - usually for soil quality concerns – to a different location on their farm. If the new parcel is larger in area than the older one, a gain is recorded. For consistency with previous year reporting, Taking Root attempts to minimize any gains recorded by soliciting that the total area of new parcels is similar to the original area.

Table 13.a: Losses from previous vintages replaced in 2015

PV Number	Full Name ⁱⁱ	Parcel Number	Technical Specification	Original area (ha eq.)*	Loss in area (ha eq.)*	Area remaining (ha eq.)*	Original tCO ₂	Loss tCO ₂	tCO ₂ remaining

Appendix 4: Monitoring Results

The following worksheets contain Taking Roots' 2014 monitoring for 2010-2013 plan vivos, and 2015 plan vivos. Note that the data provided is for area monitors, which in some cases is not the full area planted for the given year.

Description of indicators used

Vintage	The year the plan vivo was planted
Monitoring year	The calendar year the parcel was monitored
Monitoring target reference year	The year of monitoring since planted, which determines the monitoring targets to be met
Target basal area (m2)	The target basal area in m2 required to meet target
Cleaning target	Percentage of cleaning that must be completed to meet target
Pruning target	Percentage of pruning that must be completed to meet target
Trees planted target MS	Number of trees per hectare that must be planted to meet target for Mixes Species Tech Spec
Trees planted target BP	Number of trees per hectare that must be planted to meet target for Boundary Planting Tech Spec
Trees planted target S	Number of trees per hectare that must be planted to meet target for Silvopastoral Planting Tech Spec
Target met	Was the target met? Pass indicated with '1' and fail indicated with '0', with total percentage being a weighted pass rate
Threshold met	Was the threshold met? Pass indicated with '1' and fail indicated with '0', with total percentage being a weighted pass rate

Notes

1. Different targets are required for different monitoring years, as indicated by the *Monitoring target reference year*. Full details are available in the Technical Specifications.
2. If all required targets are met, producer receives full payment. If some targets only meet the threshold, producer receives partial payment. If some targets do not meet threshold, payment is not received.
3. For 2014 parcels, the target for year 1 of monitoring is the same as the threshold. For this reason, no partial payments were made for 2014 plan vivos (all parcels that didn't meet the target are marked with '0'). Smallholders with monitoring results marked as n/a refers to those who planted trees after the monitoring for 2014 parcels was complete.
4. Parcels that were not monitored are included but are marked with n/a in the monitoring requirement columns.

2014 Monitoring Results for 2011 Plan Vivos

Vintage	2011
Monitoring year	2014
Monitoring target reference year	4
Cleaning target	90%
Pruning target	90%
Trees planted target MS	375/ha
Trees planted target BP	200/ha
Trees planted target SP	180/ha
Target basal area (m2)	.86 m2 / ha
Percentage of land meeting target	33%

2014 Monitoring Results for 2012 Plan Vivos

Vintage	2014
Monitoring year	2012
Monitoring target reference year	3
Cleaning target	90%
Pruning target	90%
Trees planted target MS	375/ha
Trees planted target BP	200/ha
Trees planted target SP	180/ha
Percentage of land meeting target	87%

About Taking Root:

Taking Root is a pioneer in leveraging the forest carbon offset industry to promote economic development amongst smallholder farmers in Central America. As a not for profit, its mission is to use reforestation as a tool to mitigate climate change, restore ecosystems and improve livelihoods. This is achieved by encouraging smallholder-farming families to reforest the under-utilized parts of their farms using native tree species in exchange for direct payments over time as the trees sequester carbon from the atmosphere. These carbon sequestration services are then marketed and sold directly within Canada and through channel partnerships in Sweden, Germany, Switzerland, England, the USA and Spain.
