Reporting period		1 st August, 2011 to 31 st July 2012	
Technical specifications in use		1. Woodlot. 2. Boundary planting (BP) 3. Dispersed Systematic Inter-planting (DSI) 4. Citrus orchard. 5. Mango orchard.	
Area under management (ha) i.e. implemented <i>plan vivos</i>	Areas put under management since last report (ha)	Total 725 ha + 9157 (100m units) of BP	Total 235 ha + 3414 (100m units) of BP
Smallholders with <i>plan vivos</i> and PES agreements (total for project)	New smallholders with PES agreements since last report	274	0
Community groups with <i>plan vivos</i> and PES agreements (total)	New groups with PES agreements since last report	17	0
PES made to communities to date (\$)		0	
Plan Vivo Certificates issued to date		22,550	
Submission for Certificate Issuance for new areas under management (tCO ₂)		0	

1.0 BACKGROUND.

Trees of Hope is a certified Payment for Ecosystem Services (PES) project being implemented in Malawi by the Clinton Development Initiative (CDI), using the Plan Vivo Standard. Its main pursuit is to coordinate community-led efforts in climate change mitigation and adaptation through agro-forestry and reforestation activities. It further strives to improve community livelihoods, not only through services derived from the tree-based land use systems, but also via facilitation of access to carbon finance from the sale of Plan Vivo Certificates. The program is currently operating in Dowa and Neno districts of central and southern Malawi in its pilot phase. This report presents a general state of the project including on developments, events and challenges besides other matters that occurred during the reporting period.

2.0 KEY DEVELOPMENTS IN THE PROJECT.

During the year, several developments took place in the project. The major ones are highlighted below:

2.1 Project certification by the Plan Vivo Foundation.

Since its inception Trees of Hope had been striving to achieve certification by the governing body of the standard being used by the project, the Plan Vivo Foundation. Over the years, the project has undergone several reviews that inform certification decisions by the Plan Vivo Foundation. Having satisfied the necessary requirements, Trees of Hope was registered in September 2011. It remains the only Plan Vivo-certified project in Malawi.

2.2 Marketing effort

Trees of Hope project has over the period following its certification, been working to market its Plan Vivo Certificates primarily to international clients. Courtesy of this drive, the project has established important linkages with brokers internationally to further promote the project to the outside world. Such reliable linkages with brokers and buyers include the U&We Group consisting of U&We AB and ZeroMission AB based in Stockholm, Sweden and

the Carbon Offsets To Alleviate Poverty (COTAP), a non-profit company registered in the United States based in Oakland, California. Through these linkages, over 11 000 Plan Vivo Certificates from the project have been sold and Trees of Hope is hopeful that greater volumes of Plan Vivo Certificates will be sold through these and other linkages as they get more established and able to reach out to a wider market. The project is, on the other hand, also exploring the local Malawian market by reaching out to various companies and institutions for possible market-based linkages.

2.3 Project membership to Civil Society Network on Climate Change (CISONECC).

Trees of Hope has been collaborating with several partners, local and international, to foster teamwork for improved efficiency in project delivery and sustainability. Several public and private institutions have partnered with the project and in the same spirit, Trees of Hope project was accepted as a member of the Civil Society Network on Climate Change (CISONECC) in November 2011. CISONECC is an umbrella body of civil society organizations whose objectives centre on climate change management in Malawi. It exists to pull together civil society effort in climate change initiatives and share lessons on effective climate change management in the country. It is also the official civil society lobbying mouthpiece with the Malawi government on climate change policy direction and other related matters.

2.4 Recruitment of new producers

Community members who had not yet joined the program continue to show interest to join it. This is attributed to the on-going awareness campaigns that educate communities on the importance of trees in not only addressing climate change but also improving and protecting their livelihoods. In response, the project cautiously registers some of the applicants driven by the projects capacity to sell Plan Vivo Certificates. During the 2011/2012 growing season, the project registered 356 new producers covering 3414 (100m units) of boundary planting and 235 ha of the other land use systems.

2.5 Improved farmer record-keeping and registration procedures

The project recognizes the importance of admitting farmers who voluntarily want to participate in the project following sensitization campaigns. This is important for sustainability and the project is in the process of introducing an application form for admission into the project (see Appendix 13.1). The form is used as an expression of interest to participate in the project and a declaration of good understanding of project principles, plus ascertaining land ownership and availability of enough adult labour to sustain tree management operations. Planting will proceed on a producer's plot only after the application has been received and reviewed by CDI following another successful parallel receipt and review of the associated plan vivo. For existing farmers, this application process will be applied retrospectively. The project is also processing passport-size photographs for all participating farmers and their local monitors for easy identification and follow-up. Each producer's file will thus contain an application form with a passport photo, a plan vivo, a sale agreement if signed yet, and other relevant information.

2.6 Linkage between Trees of Hope and Anchor Farm projects

The Clinton Development Initiative besides coordinating the Trees of Hope project, also implements another project in Mchinji and Kasungu districts called The Anchor Farm Project. The project pursues a model where a commercial farm anchors thousands of small scale farmers surrounding the farm through provision of improved agronomic practices of selected crops, provision of improved seed, linking them to credit-lending institutions and helping access profitable markets for their produce. The anchor farm project currently promotes soybean production as the main crop both on the commercial farm and among the participating smallholder farmers. It further attempts to address issues of environmental degradation and soil health to ensure sustainable crop production.

The Clinton Development Initiative (CDI) moved to exploit potential synergies between the two projects by integrating them. As such Trees of Hope project is in the process of introducing the project to Anchor Farm Project farmers in Mchinji and Kasungu districts and similarly soybean project is being introduced in Dowa district among carbon farmers. It is expected that the integration will result in greater benefits to the farmers through

broadened income bases and other livelihood benefits. Dowa, Mchinji and Kasungu districts have similar climate and fall under the same agro-ecological zone, the Lilongwe-Kasungu plain. They also belong to the same agricultural administrative division, the Lilongwe Agricultural Development Division (ADD). Sensitization and recruitment campaigns are currently underway in both districts.

3.0 KEY EVENTS IN THE PROJECT.

In the course of its work, Trees of Hope participates in and hosts many events. Several key events are described below.

3.1 Participation at the Climate Compatible Development (CCD) workshop in Leeds.

The work of Trees of Hope has been noticed by other international initiatives pursuing similar objectives in climate change and development. As a leading project in the country, it is often requested to partner with institutions and share its growing experience to inform emerging programs. In the same vein, it pleased the World Universities Network (WUN) and Centre for Climate Change Economics and Policy (CCCEP) to invite Trees of Hope to a workshop on Climate Compatible Development in sub-Saharan Africa held from 15-17th May 2012 at the University of Leeds, UK. This workshop formed part of the WUN funded project entitled '*Building Partnerships and Research Capacity for Climate Compatible Development in sub-Saharan Africa*' that aims to share best practice knowledge between leading academics and practitioners and to develop a key synthesis paper to guide future research across Tanzania, Malawi and Zambia. Trees of Hope benefitted immensely from its participation by sharing notes with several other players and experts in the field of climate change and feels humbled to be part of research institutions into the climate compatible development initiative.

Climate compatible development moves beyond the traditional separation of adaptation, mitigation and development strategies. Instead it emphasizes climate strategies that embrace development goals and strategies that integrate the threats and opportunities of a changing climate.

3.2 Visit to Trees for Global Benefit Plan Vivo project in Uganda.

Trees of Hope project visited a fellow Plan Vivo project, the Trees for Global Benefit in Uganda, which is coordinated by Environmental Conservation Trust of Uganda (ECOTRUST). The purpose of the visit was to share experiences on best-practice procedures in running Plan Vivo projects. Several aspects were discussed including farmer recruitment, data management, marketing and management of carbon finance. Trees of Hope wanted to learn from ECOTRUST on various operational and organisational issues including field procedures on farmer recruitment, data management, training approaches, marketing, and management of carbon finance. Figure 1 shows a community nursery in the Trees for Global Benefit project visited on a field tour.

Figure 1: Field visit to a community nursery in Hoima District in Uganda

4.0 KEY CHALLENGES IN THE PROJECT.

4.1 Drought and burning.

Drought presents a challenge to the survival of young trees in some project sites. Aware of this reality, the project is promoting improved silvicultural practices to mitigate the effects of water stress on young trees. These adjustments include digging bigger planting holes to increase the water holding capacity within the rooting zone and to allow easier proliferation of roots. Producers are also trained in the making and use of compost manure to improve water retention in the root zone. Courtesy of these initiatives, the survival rate of trees has

increased in these areas and healthier tree stands are possible. Figure 2 below shows a woodlot in Neno district established with the said adjustments. On the other hand, producers are suggesting additional native tree species on the basis of their known tolerance to drought conditions for inclusion in the project. However, the proposed tree species are not yet in use pending review for their suitability in the current version of technical specifications or developing new technical specifications altogether should they be found incompatible with the current version.

The project has also been managing the malpractice of reckless burning of bush especially during summer by educating communities on the effects of such fires on the environment, their trees and general livelihoods. They are also trained in measures for protecting trees in an event of such fires and courtesy of this effort, communities are now aware of the dangers of bush fires and mobilize themselves led by the local program monitors and traditional leaders to curb the malpractice and protect their trees.

Figure 2: A woodlot in Neno district

4.2 Measuring plot sizes.

The total area of the plot on which trees are planted needs to be known to enable a number of statistics to be calculated, including land holding size, and to enable planning for number of seedlings to develop, and calculating the carbon credit potential. Communities led by their Local Program Monitors (community volunteers coordinating the program at

community level), have been measuring these areas themselves following conventional methods using pacing coefficients and ropes pre-marked with known measurements. These approaches are also widely used by Ministry of Agriculture extension staff as standard procedures for measuring plot sizes in communities. However, these methods much as they are accurate, are tedious and time-consuming. To improve the efficiency of this exercise, the project is in the process of training the Local Program Monitors in the use of GPS units to quickly and easily measure the areas of plots as an improvement over the conventional methods.

4.3 Plan Vivo database functionalities

As in all Plan Vivo projects, data collection, storage and processing is one of the most important aspects of project delivery. Similarly, Trees of Hope project manages all its data in a generic database that tracks all vital operations of the project. However, the designers of the database and its stakeholders might wish to explore its robustness to easily handle cases that might not have been initially foreseen like situations where a producer has more than one land use system in one plan vivo but monitored independently. Such cases under Trees of Hope project are common in an effort to allow farmers wider choices on the available land use systems.

5.0 ACTIVITIES, TOTAL PROJECT SIZE AND PARTICIPATION.

Producers in the program are engaged in any of the five land use systems briefly described below. A producer can engage in more than one land use system.

5.1 Woodlot land use system.

The woodlot land use system involves the establishment of indigenous and/or naturalised tree species on a plot in a systematic manner following the approved technical specifications. Besides carbon finance, the trees are primarily grown for construction materials, reducing soil erosion by checking surface run off, shade, medicines and aesthetic

value to landscape. The tree species in use include *Acacia polyacantha*, *Melia azederach*, *Senna siamea* and *Senna spectabilis*. Figure 3 below shows a woodlot in Dowa district.

Figure 3: A woodlot in Dowa district.

5.2 Dispersed Systematic Inter-planting (DSI) land use system.

This system involves inter-planting fertility-improving trees with arable crops, ideal for producers with limited land. The primary purpose of this system is to improve soil fertility over time through addition of degradable organic matter to the soil and biological nitrogen fixation. The deep-rooting tree species absorb nutrients from deep soil layers, unreachable by the shallow-rooted arable crop, bringing them to the surface for the benefit of the crop. The main tree species for the system is *Faidherbia albida* which is initially established at a density of 200 trees per hectare.

5.3 Boundary Planting (BP) land use system.

As the name implies, this involves planting selected tree species in a linear fashion around amenities but is commonly used around producers' farms for boundary demarcation. The tree species used are carefully chosen to avoid those that would compete with crops. Preferably, such tree species also ought to be fertility-enhancing through nitrogen fixation and addition of valuable soil organic matter. The species being used in the program currently include *Acacia polyacantha*, *Senna spectabilis* and *Senna siamea*, which are established at a spacing of 3 metres in a single row.

5.4 Citrus fruit orchard land use system.

This is one of the fruit-based land use systems in the program. It involves the establishment of citrus orchards using high-value varieties established using grafted materials. The types currently being used in the program are *Citrus sinensis* and *Citrus reticulata* established at a density of 400 trees per hectare. Besides carbon finance, the system will improve nutrition of households through consumption of the fruits but also increase their income through selling fruit.

5.5 Mango fruit orchard land use system.

Producers using this technical specification establish mango orchards with high-value cultivars, which are less fibrous than local cultivars to increase the marketability of the fruit. Grafted materials are used to reduce the period to fruiting (to about 4 years) in comparison with local ungrafted materials which take longer. Currently the project has some orchards that are coming into fruit-bearing age and farmers have started harvesting some fruits and selling locally though at small scale. Data are being compiled to track the progress and utilization of these harvests as the production gathers momentum and this will be included in the subsequent reports. Besides carbon finance, the system will improve nutrition of households through consumption of the fruits but also increase household income through selling of fruit. The varieties in use include Kent, Zill, Tommy Atkins and Erwin. Figure 4 below shows mango seedlings in a green house in Neno district.

Figure 4: Mango seedlings in a green house in Neno district

6.0 PROFILE OF RECRUITMENT, PARTICIPATION AND PROJECT SIZE.

Producers registered with the program, each with a single *plan vivo*, are either individual households or communal groups. Producers can opt for and manage more than one land use system and this is common among individual producers, while communal groups are engaged in woodlot land use system. The general profile of recruitment and participation is shown in Table 2 below.

Table 2: General profile of recruitment and participation.

Statistic	Value
Total producers (Plan Vivos)	1656
Group Plan Vivos	152
Individual Plan Vivos	1504

The area coverage for each of the land use systems for farmers covered in this report is shown in Table 3 below:

Table 3: Area coverage for the land use systems.

Land use system	Units	Area coverage
Woodlot	Ha	294
DSI	Ha	350
Mango orchard	Ha	42
Boundary Planting	100 metres (m) units	9157
Citrus orchard	Ha	39

7.0 SUBMISSION FOR PLAN VIVO CERTIFICATE ISSUANCE

In this report, the project is not making a submission for plan vivo certificates as it is still managing the lot from the previous issuance of 22,550 certificates reshown in this report in Table 4 as unsold stock. The full list of producers allocated these certificates appears in

Appendix 13.2. Should need arise for more certificates to be issued before the next annual report, the project will place an interim certificate issuance request.

Table 4: Plan vivo Certificates previously issued to the project.

Total volume of unsold stock (tCO ₂)	Total number of producers/ producer groups allocated 'unsold stock'	Total area (ha)	Technical specification applied	Price to producer/group (\$/tCO ₂)
22550	291	24.5	Woodlot	4.4
		45.3	DSI	
		1411.5	Boundary Planting	
		4.5	Mango orchard	
		11.8	Citrus orchard	

8.0 SALES OF PLAN VIVO CERTIFICATES.

The Plan Vivo Foundation in the outgoing year, issued 22,550 Plan Vivo Certificates into the project's account held at the Markit Environmental Registry to enable the project sell them to potential buyers. So far over 10,000 Plan Vivo Certificates have been sold from this lot though payments to farmers have been delayed to allow completion of some necessary procedures. However, a lot of progress on these procedures has been made including identification of eligible producers, calculation of their payments and identification of the bank to handle the payments. The bank, First Merchant Bank, is currently opening bank accounts for the recipients in their names. This bank was chosen from several that were screened to handle carbon finance for the project on grounds that its product and procedures were found appropriate and convenient. Having accounts in the names of the producers promotes accountability, transparency and credibility in the system of handling payments. Besides opening the accounts, the account holder's money will be loaded into a card which will be issued to the producer. Furthermore the bank has a wide network of service centres even in the remote areas where the producers are, bringing their money

within easy reach. It is the expectation of the project that payments to the farmers will be made within May 2013. Table 5 below shows the current sales profile of the Plan Vivo Certificates issued to the project.

Table 5: Sales of Plan Vivo Certificates

Vintage	Name of purchaser	Plan Vivo Certificates sold (tCO ₂)	Price per certificate	Currency	Total received (Euros)
2010	ZeroMission AB	1600	6.40	Euros	10240
2010	United Bank of Carbon	550	8.00	Euros	4400
2010	AECOM	600	6.40	Euros	3840
2010	COzero Pty Ltd	100	6.40	Euros	640
2010	ZeroMission AB	6000	5.80	Euros	34800
2010	COTAP	468	9	USD	4212
2010	CDI Account	13232			
Total		22550			

9.0 SUMMARY OF MONITORING RESULTS.

During the period for this report, the project undertook monitoring for the second period (year 2) for producers who were successfully monitored at Year 1 monitoring target. New producers were also recruited into the program during the year and these were monitored at Year 1 target. Table 6 below shows the summarized profile of the program regarding total volume of tCO₂ for both successful and unsuccessful producers following the monitoring for Years 1 and 2 for targets of 50% and 75% establishment of plot respectively.

Table 6: Progress towards delivery of carbon benefits in the project.

Land use system	Year 1 monitoring results (tCO ₂)		Year 2 monitoring results (tCO ₂)	
	Successful	Unsuccessful	Successful	Unsuccessful
DSI	6847	4622	10503	3253
Boundary planting	27095	5246	34296	8951
Woodlot	4382	3563	16124	4676
Citrus orchard	66	27	1106	546
Mango orchard	111	306	628	510
Totals	38501	13764	62657	17936
Project total				
Successful (currently meeting targets)	101,158			
Unsuccessful (not currently meeting targets)	31700			

During the period of this report, monitoring of *plan vivos* was conducted which involved two groups of producers. One group comprised producers monitored on Year 1 monitoring target which required producers to have not less than 50% of the total number of trees expected on their plots at the time of monitoring. The other group comprised producers monitored on Year 2 monitoring target which required producers to have not less than 75% of the total number of trees expected on their plots at the time of monitoring. Monitoring was conducted by Local Program Monitors (LPMs) by counting live trees on the plots and recording the data on forms. Field Officers for the project based in the districts coordinated the field exercise and compiled the data for analysis. Appendix 13.3 shows a list of producers with successful monitoring results for Year 2 and their carbon credits while Appendix 13.3 shows list of farmers with unsuccessful monitoring results for Year 2 target and their carbon credits. Appendices 13.4 and 13.5 show lists of producers with successful and unsuccessful monitoring results respectively for Year 1 along with their respective carbon credits.

9.1 Reasons for unsuccessful monitoring results and corrective actions.

Plan vivos for all producers registered with the program undergo routine monitoring to assess several aspects including correctness of planting (planting density), and general management (weeding, fire breaks, protection from animal damage etc). At a designated monitoring period, Years 1 and 2 in the present case, this routine monitoring culminates in an assessment of whether the monitoring targets for the respective years (at least 50% of plot established for year 1 and at least 75% of plot established for year 2) in the present case, has been met or not. All producers who meet the target for the applicable monitoring period are deemed successful otherwise they are declared unsuccessful and advised accordingly ahead of the next monitoring period.

Failure by producers to have the expected minimum number of trees on a plot as required by the monitoring milestone was attributed to several factors as indicated in Table 7 below along with corrective actions recommended by the project's monitoring team.

Table 7: Summary of reasons for target failure and recommended corrective actions.

Number	Reason for target failure	Recommended corrective actions
1	Drought, where young seedlings die under water stress.	• Digging planting holes of the recommended size for adequate water capture. • Use of compost manure to enhance water retention within the rooting zone of the tree. • Early planting to take advantage of the full rainy season. • Introducing tree species that are more tolerant to drought.
2	Termite attack. This kills young seedlings.	• Application of inorganic termicides. • Use of organic termicides like <i>Tephrosia vogelii</i> extracts. • Keeping grass mulch clear of the tree base.
3	Late planting	• Early land preparation for tree plots to avoid competition for the limited labour with arable crops later in the season. • Timely establishment of nurseries to have seedlings ready

Number	Reason for target failure	Recommended corrective actions
		for planting at the beginning of the rainy season.
4	Planted less than the target number of trees.	• Early land preparation to avoid crisis planting. • Establishment of enough seedlings for the planned planting.

10.0 PAYMENT FOR ECOSYSTEM SERVICES (PES) UPDATE.

Though the project has sold some Plan Vivo Certificates, payment to the allocated farmers has, however, not been done yet pending completion of payment procedures which are currently at an advanced stage to enable making payments within May 2013 (see section 8.0 above).

11.0 ONGOING COMMUNITY PARTICIPATION.

To ensure effective community participation, emphasis is put on engaging communities and producers on various aspects of program delivery. For purposes of ensuring effective communication and easy access to program information, communities chose from amongst themselves, voluntary leaders called Local Program Monitors (LPMs), who coordinate the program at community level. Currently, the program has 49 such volunteers who act as a link between the community, CDI, and other stakeholders.

Recognising the importance of knowledge in effective program delivery and sustainability in communities, meetings and training session are regularly organised that cover diverse issues relevant to the program. Figure 5 below shows farmer training in Dowa and Local Program Monitors in Neno district.

Figure 5: Farmer training in Dowa (left) and local program monitors in Neno (right).

These training sessions target communities in general, LPMs and registered producers to ensure that producers understand the requirements of the program to enable them make informed decisions in joining and carry out their activities in line with its principles. The LPMs receive more detailed and frequent training from CDI staff than producers, with the expectation that they in turn train fellow producers to supplement efforts by CDI staff. Several modules are covered in the trainings including those outlined in Table 8 below:

Table 8: Content of training modules.

No.	Module	Brief content and rationale
1	Climate change and rural livelihoods.	Covers definition, causes and illustration of climate change effects with local indicators and its impact on rural livelihoods.
2	Climate change adaptation and mitigation.	Presents possible strategies for avoiding further dangerous climate change and mechanisms to learn to live with the present effects. The role of trees in climate change management is discussed.
3	The Trees of Hope Project: An overview.	This presents the objectives of the project and other building blocks of the program as a vehicle available to the communities to address climate change and safeguard and improve livelihoods.
4	The Plan Vivo	Covers all tenets of the Plan Vivo system touching on all aspects

No.	Module	Brief content and rationale
	System.	from definition of a <i>plan vivo</i> to payment of carbon finance.
5	The concept of carbon trading.	Introduces the new paradigm of carbon trading and carbon markets by defining the product to be produced by them as producers and outlining requirements of the market.
6	Tree nursery establishment and management.	This looks at nursery techniques including choice of site, fencing, seed pre-treatment, media preparation, pot filling, sowing, development of root stocks, grafting, budding, root pruning, pest and disease management and hardening off.
7	Establishment and management.	Covers selection of site, pegging and marking according to the technical specification, pitting, planting, mulching, pest and disease management, fire breaks, thinning and pruning.
8	Field monitoring.	This outlines monitoring indicators and specifies what data are to be collected, highlighting the target for each monitoring period.
9	Receipt of carbon finance.	This covers mainly the dividing criteria between eligibility and non-eligibility for receipt of carbon finance depending on monitoring results. Also covers issues about farmer payment procedures.
10	Group dynamics.	Looks at advantages of working in groups, group formation, group leadership, team building, motivation and trust building.

Through these trainings, producers understand climate change and its impact on their daily lives including what roles they could play to minimise further damage to the climate system while on the other hand, living positively with it. They further understand what Trees of Hope, as a project stands for, coupled with good understanding of the Plan Vivo system which governs its operations in addition to having knowledge of carbon trading which was non-existent before these trainings. They now recognize they are engaged in a trade and not an aid system.

Courtesy of this training, communities are now able to establish and manage their own nurseries and plantations successfully with reduced supervision. The question of what it takes to qualify for carbon finance is now better understood than before along with good

knowledge of monitoring protocols on which the decision is based. Currently nursery establishment and management are done in community-based groups that are functional and cohesive, courtesy of the module on group dynamics. To keep track of trainings and meetings conducted in the program, special forms are used to record such events by recording among other things, the objectives of the event, facilitators, target audience, attendance and main resolutions.

11.0 BREAKDOWN OF OPERATIONAL COSTS.

Finances for the project are handled by a central finance office that also manages finances for other projects under the Clinton Development Initiative (CDI) in Malawi. Table 9 below shows the profile of operational costs between August 2011 and July 2012, the period covered by this report.

Table 9: Breakdown of operational costs

Expense	Description	Amount (USD)	Contribution from Plan Vivo certificates	Contribution from other income (USD)
Personnel.	Salaries for Program Director and Field Officers.	146,155	0	146,155
Office/admin	General administration costs	15,988	0	15,988
Equipment	Tools for community nurseries and stationery.	15,872	0	15,872
Travel	Local project supervision.	26,819	0	26,819
Consultancy				
Audit, technical	Validation and payment for technical support	12,426	0	12,426
Training fees and travel	External travel.	17,298	0	17,298

12.0 PLANS FOR THE SHORT-TERM FUTURE.

Following certification of the project, the focus will now be to continue improving the quality of operations and looking forward strategically as the project grows. In the short term, the project will be pursuing several tasks included those outlined below:

12.1 Marketing strategy development and execution.

Trees of Hope recognizes the urgency it faces to sell the Plan Vivo Certificates already issued to the project to enable further certificate issuance requests from the existing credits and allow project growth. It is thus developing and executing a marketing strategy targeting both the local and international markets. On the local market, the project intends to explore the possibility of courting local institutions and companies to invest in Trees of Hope through buying its Plan Vivo Certificates. On the international front, the emphasis will be on increasing visibility of the project and nurturing and maintaining important connections and making high-quality marketing information widely accessible to potential buyers on appropriate platforms.

12.2 Introduction of new tree species.

Feedback from farmers in the program indicates that they would like to bring into the program additional native tree species that were previously not included. However, the

proposed tree species will not be used in the project until they are assessed for inclusion into the existing technical specifications or development of new technical specifications for them if necessary.

12.3 Consolidating and broadening stakeholder relationships.

The program recognises the importance of working closely with other stakeholders in program delivery and over the years, the program has worked with both local and international partners on several aspects. Key local stakeholders include the Department of Forestry, Ministry of Agriculture and the Environmental Affairs Department (EAD). It is the intention of the project to consolidate the existing relationships and further court other relevant stakeholder institutions in response to the growth and dynamics in the project.

13.0 APPENDICES

13.1 Farmer expression of interest form.

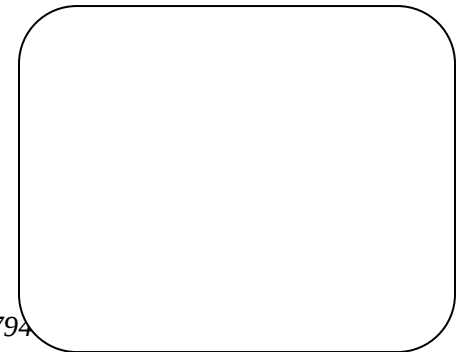

FARMER EXPRESSION OF INTEREST

TREES OF HOPE CARBON PROJECT

CLINTON DEVELOPMENT INITIATIVE

LILONGWE, MALAWI.

Tel: +265 1 794 149; +265 1 794 150; **Mobile:** +265 888 134 936; **Fax:** +265 1 794

I, with the particulars indicated below, having undergone induction training about the project, hereby express my interest to participate in the Trees of Hope Carbon Project coordinated by the Clinton Development Initiative.

Name	
GVH	
T/A	
District	
Age	
Gender	
Household size	
Next of kin	

I would like to establish land use system(s) described in the table below:

Particulars	Land use systems				
	Woodlot	Boundary planting	DSI	Mango orchard	Citrus orchard
Land use system (<i>tick</i>)					
Area (ha), distance (m)					
Total trees to plant					
Main tree species					
GPS coordinates of plot					
Year(season) of first planting					

I further declare that the land on which I intend to establish the land use system(s) shown above is my own and is free of any controversy as testified by my Village Headman below and I possess enough adult labour to successfully carry out all the required nursery and field activities for the proposed land use systems.

I also consent to Clinton Development Initiative servicing any outstanding seedling/input loans I might have with suppliers through deductions from my payments arising from sales of my credits and I further promise to cooperate with Clinton Development Initiative and her partners for the success of the program.

Confirmation of land ownership.

I, _____, Village Headman _____, hereby testify that the land in question belongs to _____ whose other particulars are in the table above and is free of controversy.

Date: _____ **Signature:** _____

Processing of application

I, _____ working as _____ on behalf of CDI, having reviewed this application and visited the proposed plot(s), hereby **accept/reject** (tick accordingly) this application.

Date: _____ **Signature:** _____

Comments/advice given:
