Immunisation Services

Streamlining processes, removing the administration load for staff and increasing vaccine uptake

inhealthcare

Our services cover all types of immunisations including but not limited to MMR, HPV, Meningitis, Tetanus, Diphtheria and Polio, Influenza, COVID-19 and antenatal.

Benefits of the immunisation solution

- Consent can be gathered at speed
- Rich reporting and data insights functionality
- Removes administration load for staff
- Reduces costs associated with postage stamps
- Easy to use for patients of all ages and technical abilities
- Increases vaccine uptake
- Early visibility of patients attending clinic meaning vaccinations are not wasted
- Reminder notifications reduces Do Not Attends

Key features of the immunisation solution

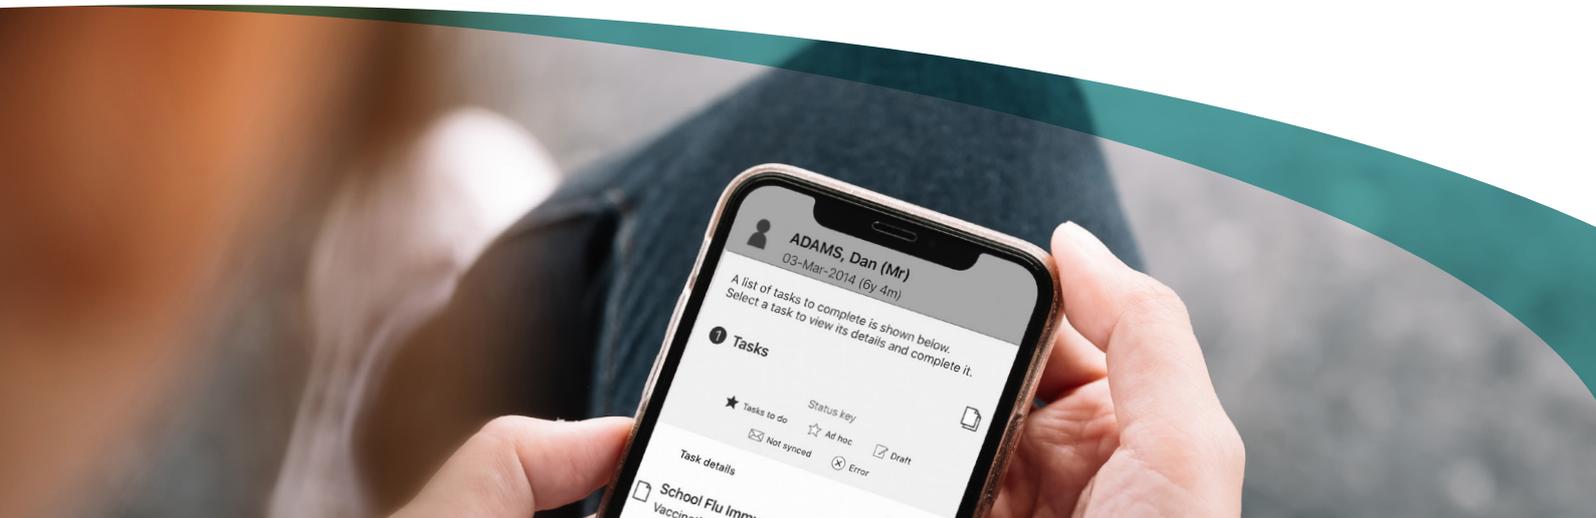

- A scalable solution usable across all types of immunisations
- Automated enrolment system
- Ability to gather consent at speed
- Rich reporting and analytics gives insights across regions
- Self-enrolment functionality
- Creates lists of patients eligible for vaccinations
- Transfers data back into the GP or community record
- Citizens can choose to book using an app, automated phone call or by going online

Rich analytics and reporting functionality

Our customers have access to our sophisticated reporting and analytics dashboards which give valuable insights into how the service is performing. The dashboards summarise a range of aspects of each service in a way that is easy to understand.

Importantly dashboards can show uptake of immunisations at a local school or population level.

This enables teams to identify uptake and areas that require additional support to drive numbers. Reporting at a regional level also allows teams to identify trends and compare results year on year. Effective reporting also enables clinical teams to allocate sufficient resources to each clinic, meaning clinics are appropriately staffed.

Child immunisations

Inhealthcare provides digital immunisation consent and health questionnaires to more than 150,000 parents and guardians as part of school aged immunisation programmes at five different NHS organisations in the UK.

The service provides parents and guardians with a fully digital solution to enrol their children to immunisation programmes. It removes manual

paper based processes and provides parents and guardians with more information on the benefits of immunisations.

The solution automates the process of triage and removes manual transcription of data into clinical systems. The digital child immunisation service enables consent from parents to be gathered at speed, avoiding the need for written letters to be sent home to parents.

4%

Increase in first wave uptake within Hull schools

13/15

Dorset Healthcare University NHS FT redeployed 13 out of 15 members of staff

50%

Reduction in time spent at schools for vaccination sessions

How does the service work?

Working with community providers and schools across Yorkshire and Humberside the service works by sending parents an email with a unique link to a questionnaire, specific to their child. The parents or guardian complete the questionnaire and the information is fed securely back to Inhealthcare.

Once the information reaches Inhealthcare, a notification is raised for healthcare professionals to review the response. The list of patients eligible for immunisation can be found via the Inhealthcare app, and the healthcare professional can note the vaccine information which is transferred back into the community record.

Flu, COVID-19 and antenatal vaccinations

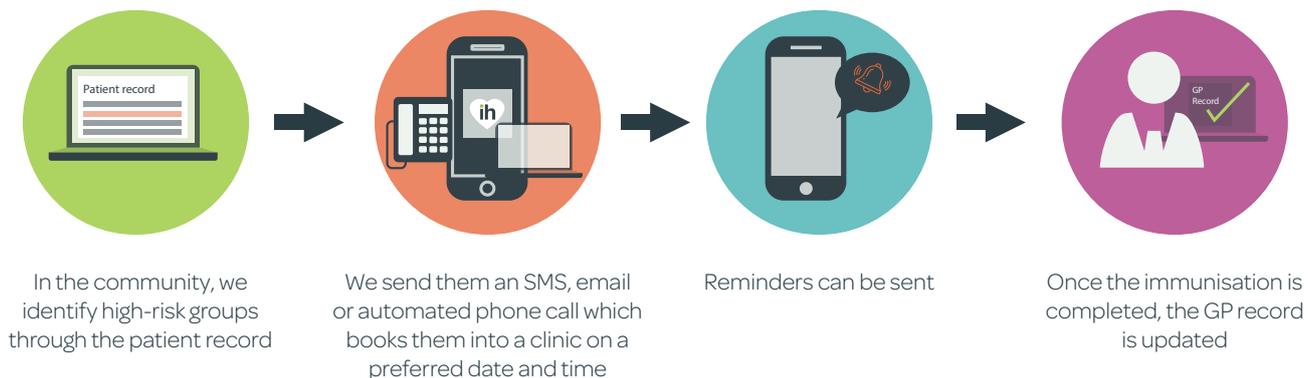

The vaccination service is an automated booking system for citizens highlighted as being at high risk of flu or COVID-19. The services can also be used for antenatal immunisations including whooping cough.

How does the service work?

The service contacts citizens via SMS, an automated phone call or online and books them into a clinic on a preferred date and time.

The list of citizens is pulled from the patient record and once the vaccination is completed, the GP record is updated.

The service was designed as part of the NHS England Healthy New Towns project, a new initiative to rethink how health and social care services can be delivered on 10 housing estates across the country.

NHS staff vaccinations for COVID-19

The NHS Staff COVID-19 Vaccination Programme was created in response to the Government roll out of vaccinations to NHS staff. The NHS Staff COVID-19 Vaccination Programme is a digital solution which ensures NHS staff are vaccinated in an efficient way, without the need for manual processes.

How does the service work?

Whilst the pathway can be customised to suit the individual needs of your organisation, the service follows these simple steps:

- Staff member completes consent form online
- Staff member attends vaccination
- Healthcare professional uses a tablet to capture immunisations
- Staff member receives a reminder for second test which occurs 21-28 days later
- Full visibility of uptake rates across the region
