

Forward Deployed Software Engineer: United Kingdom

You are a highly skilled software developer who can face down every technical challenge on the front lines of a deployment as rapidly as they surface, all with a smile on your face. Integration, installation, hardware configuration, data scripting/messaging, and the ability to deal with customer specific use-cases come as naturally to you as the fundamentals of computer science. You dive into complicated programming tasks on your own because letting them sit unfinished would bore you to the point of madness. You pick up books, pursue technical challenges, and work to expand your prowess for the same reason. You've written tight and clean code for at least a few years, and your technical chops are on par with those who write code all day, every day. Additionally, your customer-facing and project management skills are solid.

Our team puts in the time to get the job done and we know when it's time to decompress. We encourage our team towards technical strength, efficiency, and fun.

Responsibilities

- Dedication to the mission of the customer and to that of Palantir
- Scope and complete complicated deployments, which might include unusual configurations, for a range of operationally relevant clients
- Develop data integrations, customization of the Palantir platform, and entirely new services as part of your regular work

Requirements

- BA/BS from a top university in Engineering, CS, Sciences or Mathematics
- Software engineering or field engineering experience
- Extremely detail-oriented and hands-on
- UNIX/Linux background preferred
- Database experience preferred
- Ease in communicating with technical and non-technical personnel
- Agile project management skills
- Interest in finance preferred
- Willingness to travel throughout Europe required
